### Abstract

The formation of urban public centers and recreation areas is expressed in various examples and projects using the world experience, which is important for specialists in this field, in the process of study and practice, related to the development of construction, infrastructure improvement, and in the development of schematic master plans, in the development of regional planning projects. will be a support.

The main focus is on the actual problems of designing community centers and recreation areas in urban planning. On the basis of the current regulatory documents, it is necessary to cover the modern construction and practice of urban planning.

Organization of the central areas of community centers and recreation areas, formation of pre-school and school facilities, medical institutions, cultural and social service systems in community centers, placement of commercial and household service facilities, sports facilities, greening of centers and recreation areas, public transport schemes is a major factor in the formation of centers (Fig. 1).

***Figure 1. Organization of recreation areas belonging to community centers.***

It is necessary to organize administrative and communal institutions, sanatoriums and sanatoriums, protection of cultural heritage objects, environmental protection, urban planning, proper use of ecology and natural resources, land resources, residential stock, social and engineering infrastructure.

The importance of the complex urban planning document, which is the basis for deciding the prospects of the development of community centers, is very important.

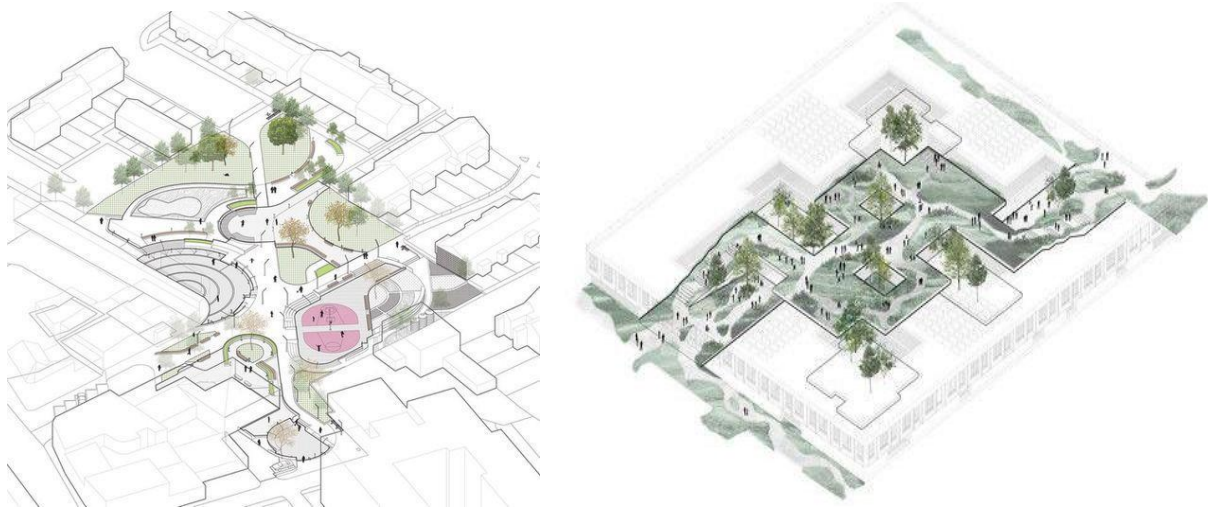

Educate specialists in this field in a comprehensive approach to urban development problems, taking into account socio-economic, transport planning, economic and other processes; at the same time, it is necessary to develop spatial perception, imagination and thinking, proportionality and harmony, and the ability to feel the scale of urban planning systems.

Revising the activities of project organizations that do not have enough interest to implement modern design methods, practical software products, science, architecture and design achievements, to attract promising young people with the ability to implement complex and high-class project-research works that meet the requirements of the time. logout is requested.

The main tasks and directions in the activity aimed at increasing the process of carrying out the unified state and scientific-technical policy in the field of urban planning are defined below. Including:

- to regularly improve and update the regulatory framework for urban planning and urban planning activities;
- coordination of design work and construction activities, organization of the involvement of advanced technologies in the construction production process;
- further deepening of market relations and further improvement of the system of state procurement in capital construction;
- is to ensure the training of qualified personnel for the fields of architecture, design and construction.

Among the priority tasks of sustainable development in our country, it is necessary to scientifically justify this issue, to expand the scope of scientific research aimed at further improving the mechanisms of its implementation, and to develop proposals of practical importance (Fig. 2).

**Figure 2. Important suggestions of the scope of scientific research aimed at sustainable development.**

The specific characteristics of the area, the orientation of highways and the historical appearance of buildings cause public centers to often move away from the geometric center of the city.

Also, the shift of the urban community center is found in coastal wetlands (often in large port cities) (Figure 3).

When designing public centers, 10% of the total area of the centers should be allocated for special short-term parking spaces for cars.

**Figure 3. Proposals relevant to the scope of scientific research aimed at sustainable development.**

The city is also very important in the formation of public centers and recreation areas. These cannot be ignored.

The development of the functions of the formation of urban public centers and recreation areas is related to the increasing needs of the people for recreation and tourism outside the cities, as well as the protection of the natural environment and the environment of the urbanized regions of the republic.

New views on the concept of sustainable development, reflecting the directions of various theories and scientific schools, it is necessary to deeply analyze the complex processes currently taking place in the world and evaluate the various factors affecting human civilization.
